Hiring Team

May 9, 2026

Knuddels GmbH & Co. KG, Karlsruhe

Unsolicited Application – Working Student Software Development (m/f/d)

Dear Knuddels Team,

Why Knuddels

Keeping a 25-year-old community platform genuinely alive – growing it, securing it, and making it more human – with a team of just 50 people is a rare engineering challenge. What stands out to me is not just the technical ambition but the purpose behind it: a platform built around real connection rather than content consumption, actively cooperating with the BKA to protect its members. That combination of engineering and responsibility is the kind of environment I want to contribute to as a working student.

What I Bring

I am currently enrolled in an M.S. in Artificial Intelligence at BTU Cottbus-Senftenberg and bring 3+ years of production engineering experience – well beyond what is typical at Werkstudent level. At Ericsson I built Python-based data pipelines and automation tools processing **12,000+ structured files daily** on AWS, working extensively with PostgreSQL and MSSQL for data modeling and reporting. I have hands-on experience with Docker, Linux, Git, REST APIs, and CI/CD-adjacent automation workflows. I am comfortable working independently and self-organizing across distributed teams – exactly the culture Knuddels describes. On the data side, I can contribute to backend data components, pipeline automation, and analytics support from day one. I am also actively learning TypeScript and React through my M.S. coursework, expanding toward Knuddels' frontend stack.

Fit

I am available for up to 20 hours per week during semester, fully remote-capable, and based in Berlin. I work independently, take ownership, and thrive in flat, transparent team cultures. I would welcome the chance for you to find the right spot for me in your team – whether that is backend data work, automation, or broader software development support.

Sincerely,

Khaleel Ahmad
