Hiring Team

May 11, 2026

Airbus Defence and Space GmbH, Friedrichshafen

Application – Internship (d/f/m) within Data Science and AI

Dear Hiring Team,

Why Airbus Defence and Space

Working on data engineering and AI solutions for satellite systems – time series anomaly detection, digital twin architectures, surrogate models, and LLM-based pipelines – in a transnational team at the intersection of aerospace engineering and cutting-edge AI is a rare and compelling opportunity. Airbus Defence and Space's Data Processing & Analytics department works precisely at the frontier I am pursuing through my M.S. in Artificial Intelligence: applied deep learning, LLM systems, and big data platform architecture for real-world, high-stakes applications.

What I Bring

I am currently enrolled in an M.S. in Artificial Intelligence at BTU Cottbus-Senftenberg, working hands-on with PyTorch, deep learning architectures, and LLM frameworks including Transformers and LangChain. My coursework covers generative AI, signal processing, and distributed systems – directly relevant to the team's active R&D topics. Beyond academic work, I bring 3+ years of production experience in Python data engineering: at Ericsson I built Apache Airflow ETL pipelines processing **12,000+ structured files daily** on AWS, developed automated anomaly detection tools, and maintained large-scale data infrastructure. This combination of production-grade Python engineering and active M.S.-level AI research means I can contribute to both the data platform architecture and the model development sides of the team's work from day one – without a ramp-up period on tooling basics. I am fluent in English (C1) and have working German (B1).

Fit

I am available from September 2026 for a 6-month internship and open to relocating to Friedrichshafen for the duration. I am proactive, curious, and comfortable presenting technical work to mixed audiences – aerospace engineers, data scientists, and project managers alike. The possibility of developing a Master's thesis topic within the internship is a strong additional motivation. I would welcome the opportunity to contribute to Airbus's internal AI solutions and R&D initiatives.

Sincerely,

Khaleel Ahmad
